

IN THE CLAIMS:

Please amend the claims as follows:

Claim 1 (Original): A pattern transfer apparatus for putting a transfer die having a concavo-convex pattern against a transfer target on a substrate to transfer the concavo-convex pattern onto a surface of said transfer target, wherein at least part of said transfer die is made of a ferromagnetic material; said pressing means includes magnetic force generating means for generating a magnetic force; said magnetic force generating means are provided to near said substrate and comprises at least two or more electromagnets; and said magnetic force generating means applies a magnetic force to said transfer die with said substrate interposed therebetween, thereby pressing said transfer die against said substrate.

Claim 2 (Canceled).

Claim 3 (Canceled).

Claim 4 (Original): The pattern transfer apparatus according to claim 1, wherein said pressing means includes a current controller for adjusting the amounts of current to flow through said electromagnets, respectively.

Claim 5 (Original): The pattern transfer apparatus according to claim 4, comprising: measuring means for measuring a distance between said substrate and said transfer die in at least two or more measuring points; and control means for receiving signals on the measuring points and the measured distances from said measuring means, determining currents to be applied to

said respective electromagnets so that the measured distances at the measuring points become a predetermined value, and transmitting a signal to said current controller.

Claim 6 (Original): The pattern transfer apparatus according to claim 1, wherein said magnetic force generating means has: at least two or more permanent magnets; and magnetic force adjustable means for changing magnetic forces to reach said transfer die from said permanent magnets.

Claim 7 (Original): The pattern transfer apparatus according to claim 6, wherein said magnetic force adjustable means includes moving means for moving said permanent magnets.

Claim 8 (Original): The pattern transfer apparatus according to claim 7, comprising: measuring means for measuring a distance between said substrate and said transfer die in at least two or more measuring points; and control means for receiving signals on the measuring points and the measured distances from said measuring means, determining a distance between said magnets and said transfer die so that the measured distances at the measuring points become a predetermined value, and transmitting a signal to said moving means.

Claim 9 (Original): The pattern transfer apparatus according to claim 1, wherein said pressing means includes a plurality of pressure cylinders.

Claim 10 (Original): The pattern transfer apparatus according to claim 9, wherein said pressing means includes a pressure controller for adjusting pressures of said pressure cylinders.

Claim 11 (Original): The pattern transfer apparatus according to claim 10, comprising:
measuring means for measuring a distance between said substrate and said transfer die in at least
two or more measuring points; and control means for receiving signals on the measuring points
and the measured distances from said measuring means, determining the pressures of said
respective pressure cylinders so that the measured distances at the measuring points become a
predetermined value, and transmitting a signal to said pressure controller.

Claim 12 (Original): The pattern transfer apparatus according to any one of claims 5, 8,
and 11, wherein said measuring means is a distance measuring device using laser reflection.

Claim 13 (Original): The pattern transfer apparatus according to any one of claims 5, 8,
and 11, wherein said measuring means is a distance measuring device using ultrasonic reflection.

Claim 14 (Original): The pattern transfer apparatus according to any one of claims 5, 8,
and 11, wherein said measuring means is a distance measuring device using a change in
capacitance.

Claim 15 (Original): The pattern transfer apparatus according to claim 1, comprising
second pressing means for pressing said transfer die against a transfer target on said substrate
uniformly.

Claim 16 (Original): The pattern transfer apparatus according to claim 15, wherein said second pressing means includes: pressure applying means; and a balloon for transmitting a pressure of said pressure applying means to said transfer die.

Claim 17 (Currently amended): A pattern transfer method for putting a transfer die having a concavo-convex pattern against a transfer target on a substrate to transfer said concavo-convex pattern onto a surface of said transfer target,

the method comprising:

a uniform pressure pressing step of pressing said transfer die against said transfer target on said substrate with uniform pressure; and

a nonuniform pressure pressing step of pressing said transfer die against said transfer target on said substrate at a plurality of different locations independently so that it is compensated to incline and distort said transfer die.

Claim 18 (Currently amended): The pattern transfer method according to claim 17, comprising the step of arranging said transfer die in parallel with said substrate prior to the uniform pressure pressing step.

Claim 19 (Currently amended): The pattern transfer method according to claim 17, wherein the nonuniform pressure pressing step includes the step of increasing a force for pressing said transfer die against said substrate, with an increasing distance between said substrate and said transfer die.

Claim 20 (Currently amended): The pattern transfer method according to claim 17, wherein the nonuniform pressure pressing step includes the step of making a force for pressing a distorted area of said transfer die against said substrate greater than with other areas.

Claim 21 (Currently amended): The pattern transfer method according to claim 17, wherein the nonuniform pressure pressing step includes the step of applying a force for pressing said transfer die against said substrate to only a distorted area of said transfer die.

Claim 22 (Currently amended): The pattern transfer method according to claim 17, further comprising a measuring step of measuring a distance between said substrate and said transfer die in at least two or more measuring points, and wherein the nonuniform pressure pressing step includes applying locally different pressing forces so that the distance measurements obtained from the measuring points in the measuring step become a predetermined value.
